DNA helicase II (EC 3.6.1.-) [validated] - Escherichia coli (strain K-12)

N;Contains: adenosinetriphosphatase (EC 3.6.1.3)

C;Species: Escherichia coli
C;Date: 17-Mar-1987 #sequence revision 10-Oct-1997 #text_change 09-Jul-2004

C;Accession: F65185; JS0014; A93528; A93498; S30703; E37841; A03549

-!- FUNCTION: Plays a critical role in MHC class II antigen processing by stabilizing peptide-free class II alpha/beta heterodimers in a complex from the role; synthesis and directing transport of the complex from the endoplasmic reticulum to compartments where peptide loading of class II takes place.
-!- SUBUNIT: Nonamer composed of three alpha/beta/gamma heterotrimers (By similarity).

-I-FUNCTION: Plays a critical role in MHC class II antigen processing by stabilizing peptide-free class II alpha/beta heterodimers in a complex soon after their synthesis and directing transport of the complex from the endoplasmic reticulum to compartments where peptide loading of class II takes place.

-I-SUBURIT: Nonamer composed of three alpha/beta/gamma heterotrimers (By similarity) Membrane; single-pass type II membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Henkes W., Syha J., Reske K.;
